CodeBlooded: from customer data to the right next action

Architecture · PTP-break prevention and next best action · CIBC Collections Hackathon · synthetic Maple Bank data

PRINCIPLES

Design rules that hold throughout

- The model supplies one number; rules decide what may happen
- Hardship can only soften treatment
- Protected attributes excluded from C360, model, gates (audited)
- A person can review anything

EVIDENCE

Measured results

- Identity: precision 99.84%, recall 97.4%
- Insight: 21/21 dev questions; all 50 answered or refused
- Model: AUC 0.6445; does not beat incumbent ptp_break v2.1
- Tests: 152 pass · data quality: 8/8 error checks pass

HONESTY

Not built / known limits

- Scores once at promise creation, not at T-3 / T-1
- No Whisper, learning loop, Promise Ledger, Context Card
- Reviewer roles are a demo directory, not authentication
- LLM planner is optional and was off for reported runs
